The UK Pesticide Guide Online – Update 05 April 2019

This is the third update since publication of
The UK Pesticide Guide 2019

This is the third update of UKPG on-line with the expiry dates of numerous products updated, a number of new products added as PARs and 81 EAMUs updated or entered for the first time. The most notable of the new product approvals are listed below.

The European Union has recently decided not to renew the approval of chlorothalonil and all products containing chlorothalonil will be subject to a phased withdrawal. This will mean the loss of 92 products from the UKPG database and make the management of disease resistance much more difficult.

- Prism (isopyrazam + prothioconazole) is a new mixture from Adama that is for control of cereal diseases.
- Dimilin Flo (diflubenzuron) now approved for insect control in amenity vegetation, ornamental plant production, hedgerows and forests where aerial application can be made on receipt of a permit from CRD.
- Convisio One (foramsulfuron + thiencarbazone-methyl) which is the ALS herbicide mixture specifically designed for use in ALS-resistant sugar beet has now gained approval.
- Evito T (fluoxastrobin + Tebuconazole) is a novel fungicide mixture from Arysta approved for disease control in oilseed rape but is currently only listed as PAR until actual availability is confirmed by the company.
- Chrysal AVB is a product for the prolongation of cut flower life. It is applied post-harvest and contains the new active ingredient sodium silver thiosulphate.
- Emerger (aclonifen) is a new pre-emergence herbicide for broad-leaf and grass weed control in potatoes.
